

Case Study

Pre-Digital Migration Analogue Telephone Audit

When a power station wanted to migrate their end of life telephone system to a digital platform an audit of existing analogue lines was required to determine line locations, routes, condition, type and extension numbers.

The Solution

The size and industrial nature of the site were always going to impact continuity of work flow and present our engineers with access limitations.

It was important to keep all parties in the flow of information, mitigate access limitations and maintain all of our time-scale based deliverables in the correct order of completion.

Producing a Gantt chart for the two month project timeline gave all parties knowledge of what was going to happen and when as well as allowing Voicepath to effectively allocate resources.

The Result

After nearly two months of survey work the report produced provided the client with accurate and up to date information of their 600 phone lines, associated extensions as well as their cable capacity.

The information gives the client the tools to make informed decisions on the digital migration, what lines can be migrated, capacity and to determine the best digital upgrade solution for their business.
